ABOUT

ArgoCon
NORTH AMERICA

NOVEMBER 12, 2024

SALT LAKE CITY, UTAH

#ArgoCon

ArgoCon is designed to foster collaboration, discussion, and knowledge sharing on the Argo Project, which consists of four projects: Argo CD, Argo Workflows, Argo Rollouts and Argo Events.

The Argo Project is a suite of open source tools for deploying and running applications and workloads on Kubernetes. It extends the Kubernetes APIs and unlocks new and powerful capabilities in application deployment, container orchestration, event automation, progressive delivery, and more.

Connect with others that are passionate about Argo and interact with project maintainers. Learn from practitioners about pitfalls to avoid and best practices on how to adopt Argo in your cloud native environment. Get inspired by

Kubernetes – The Game Changer

- Kubernetes changed the game and caused disruption
- Docker/Containerization deserves more credit
- Kubernetes + Containers: Cloud agnostic immutable infra
- Declarative Design
- Wasn't Built for Developers though!

Learning curves of some Container Orchestration Engines

GitOps – The Game is Changed Again

- Imperative process for a Declarative platform 🖐️
- Take lessons from IaC and DevOps and formalize them 💡
- GitOps Principles 📜
 - Declarative
 - Versioned and Immutable
 - Pulled Automatically
 - Continuously Reconciled
- TL;DR – Store your K8S YAML and have a controller reconcile them

OpenGitOps

<https://opengitops.dev>

Argo CD – A Better Way to GitOps

- Argo Project was created by Applatix/Intuit
- UX was a big missing piece when working with Kubernetes
- Argo CD can be seen as an early attempt at an IDP
- Abstract K8S primitives and focus on Applications
- Make Kubernetes accessible for Administrators and Developers

Argo CD – UX Centric

- Top-level health of Application.
- Based on tracked resources.
- Built-in & custom health checks.

AKUITY

Business Success Starts With Great Developer Experience

Argo CD - OSS Architecture

\$ Expensive traffic
\$ Maintenance cost

 Requires VPN or public ip

 Scaling challenges

 Multiple control planes

Managed Argo CD – Agent based hybrid architecture

- \$ Minimal traffic reduces cost
- \$ Maintenance is included
- 🔒 No external cluster access
- 🔒 No cluster credentials
- 👓 Greatly improved scalability
- 👓 Single control plane

Akuity Benefits

1. Agent based architecture
 - Pull model
 - Better security posture
 - Easy to scale
 - Better performance
2. Removes Operational Burden
 - No complex networking, VPNs, Service mesh etc.
 - Easy to incorporate Chargeback mechanisms (Pricing is based on # of Applications)
 - Easy to configure through UI, CLI or declaratively
3. Enterprise features
 - Audit Logs
 - DORA Metrics
 - SSO/RBAC
4. SaaS or Self Hosted
 - SaaS has a lower cost, easier to maintain, and does not touch sensitive information
5. Argo CD Maintainers and Contributors
 - Helping your enterprise

GitOps – The Big Question(s)

- What if I want to see my changes before they're merged?
- Do I need to create a K8S Cluster every time I want to test something?
- What if I need more flexibility in my deployments?
- It seems like a waste managing all these test instances using GitOps

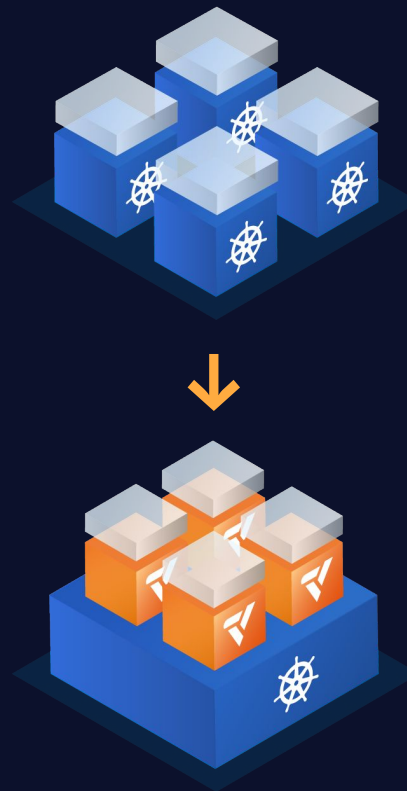

Reduce Kubernetes cost and sprawl with virtual K8s clusters

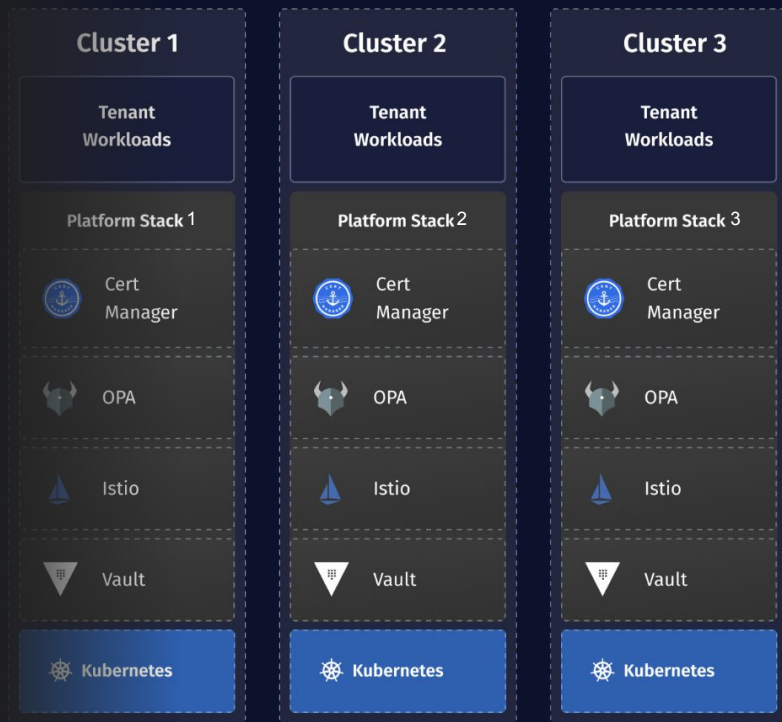

Introducing vCluster made by Loft Labs

 **40 Million+**
Virtual Clusters

 **5,000+**
GitHub Stars

Companies create **a lot** of Kubernetes clusters

A separate cluster...

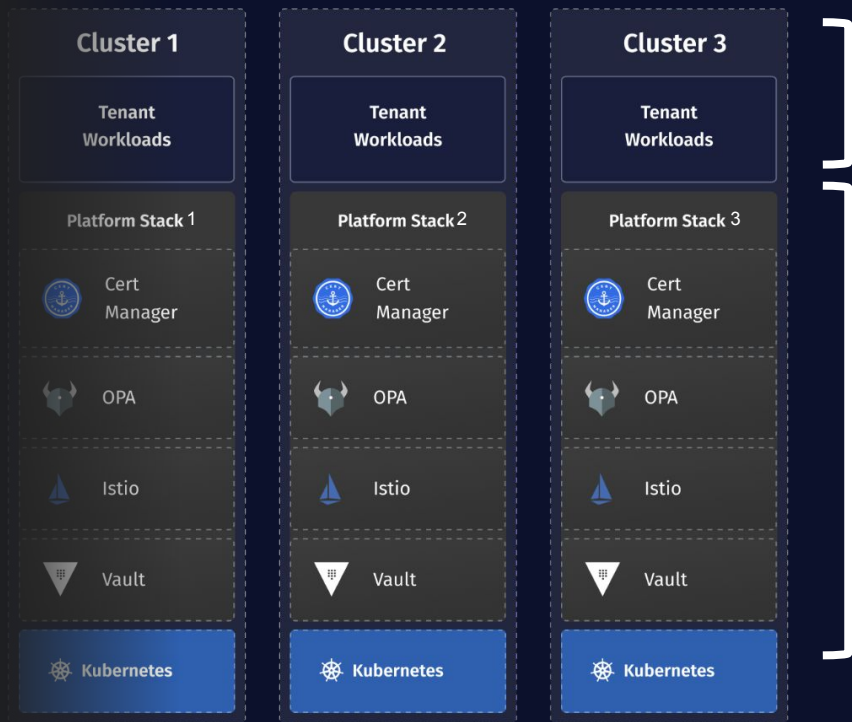

for every team

for every customer

for every environment

= 100s of clusters

Companies create **a lot** of Kubernetes clusters

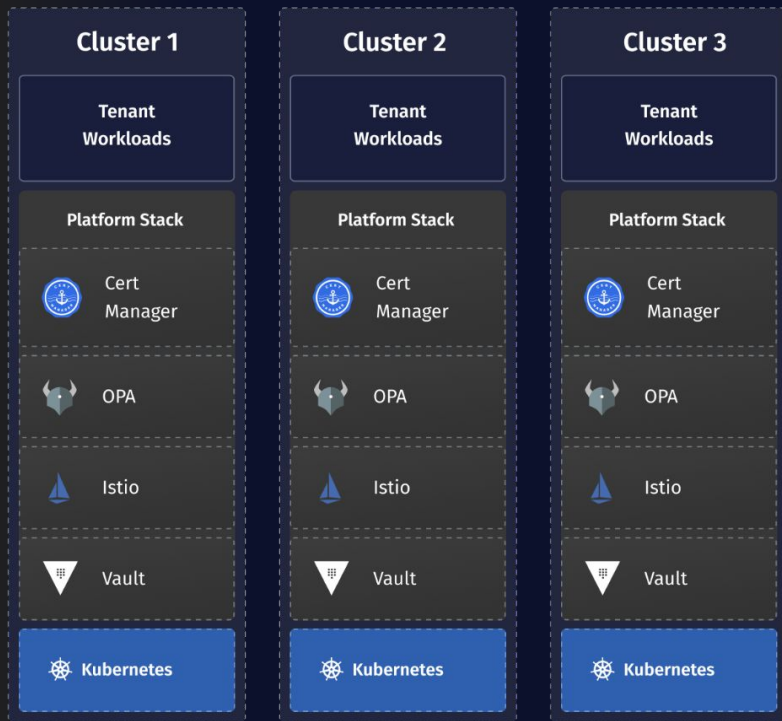

\$876 Cluster Fee **x 100 Clusters**
EKS/GKE/AKS List Price

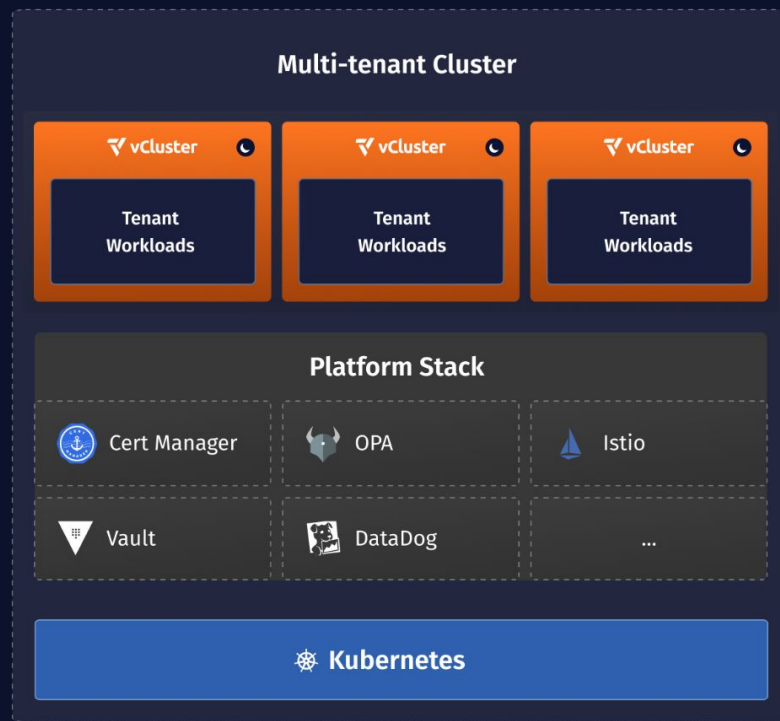

\$\$\$ Platform Stack **x 100 Clusters**
Runs in each cluster

Optimize your Kubernetes infra with **virtual clusters**

Without vCluster

With vCluster

What are **virtual clusters**?

Virtual clusters are a Kubernetes concept that enables isolated clusters to be run within a single physical Kubernetes cluster.

Sleep Mode

Reduce idle workloads cost by putting clusters to sleep when not in use.

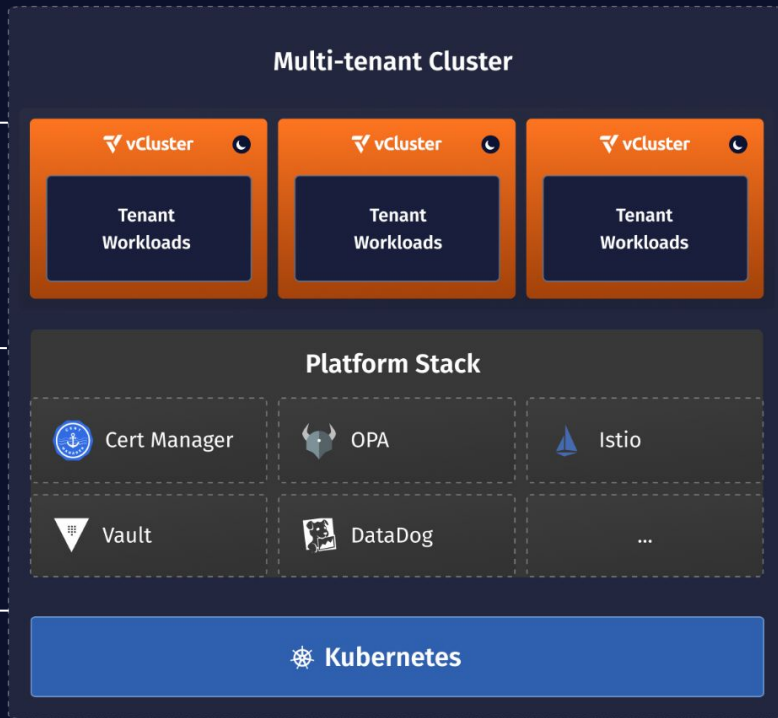

Shared Platform Stack

Run fewer duplicates of tools like Istio, Cert Manager, OPA, Datadog and Vault.

Multi-Tenant Clusters

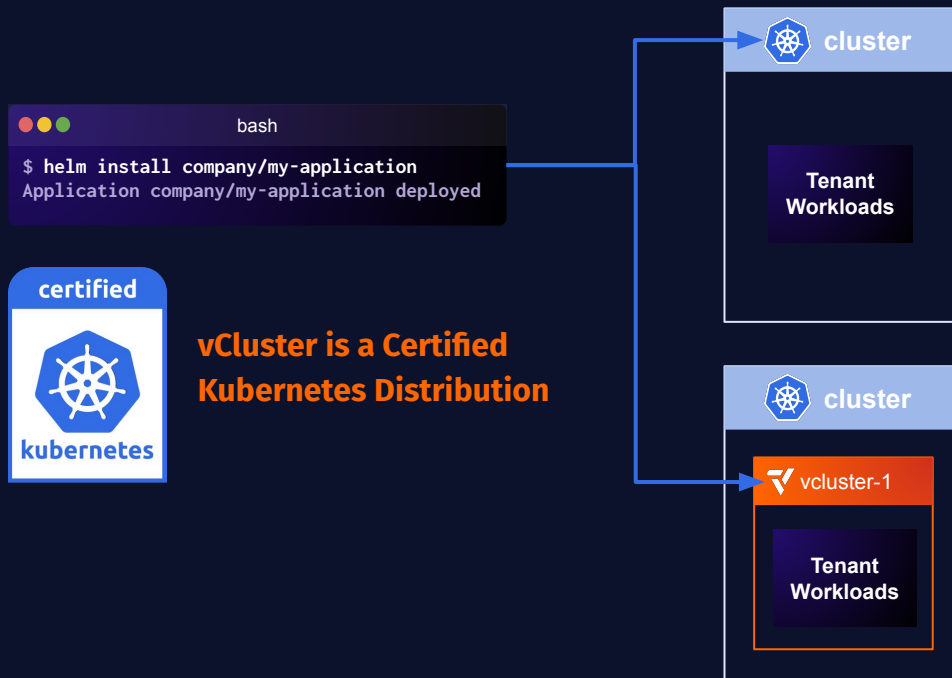

Run fewer clusters by isolating multiple tenant workloads within a single cluster.

With vCluster

+50%
Cost Savings

Seamless shift to **virtual clusters**

→ Deploy to a virtual cluster with the same tools and workflows

→ No need for re-architecting any software or changing your deployment pipelines

What **vCluster** enables you to achieve

1

Reduced
Kubernetes
cost

atlan

\$600k

reduction in
Kubernetes spend

2

Self-service
clusters for
Dev, Test & QA

ada

10x

developer
productivity

3

Multi-tenancy
for production
apps

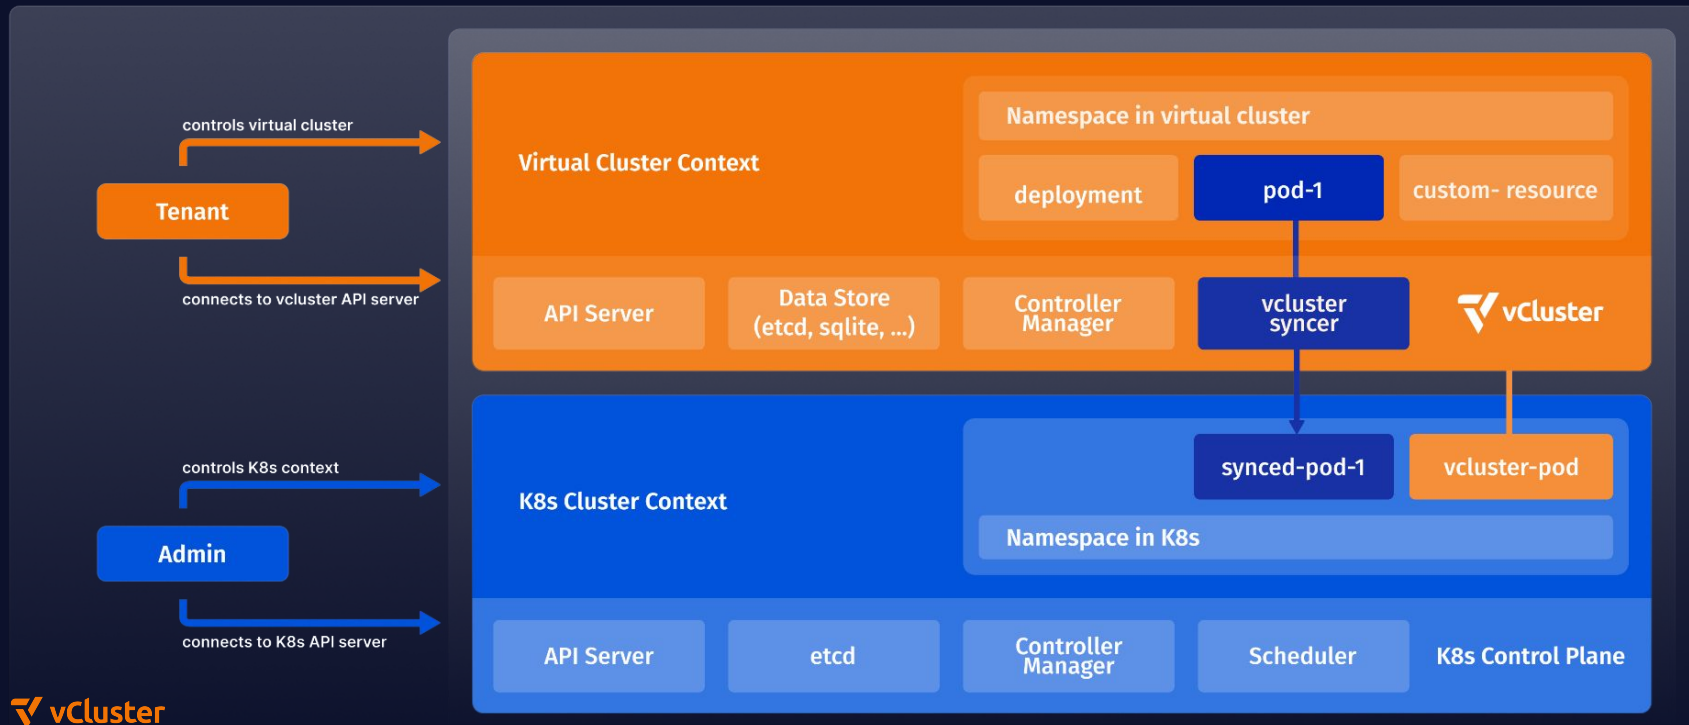

CoreWeave

100's

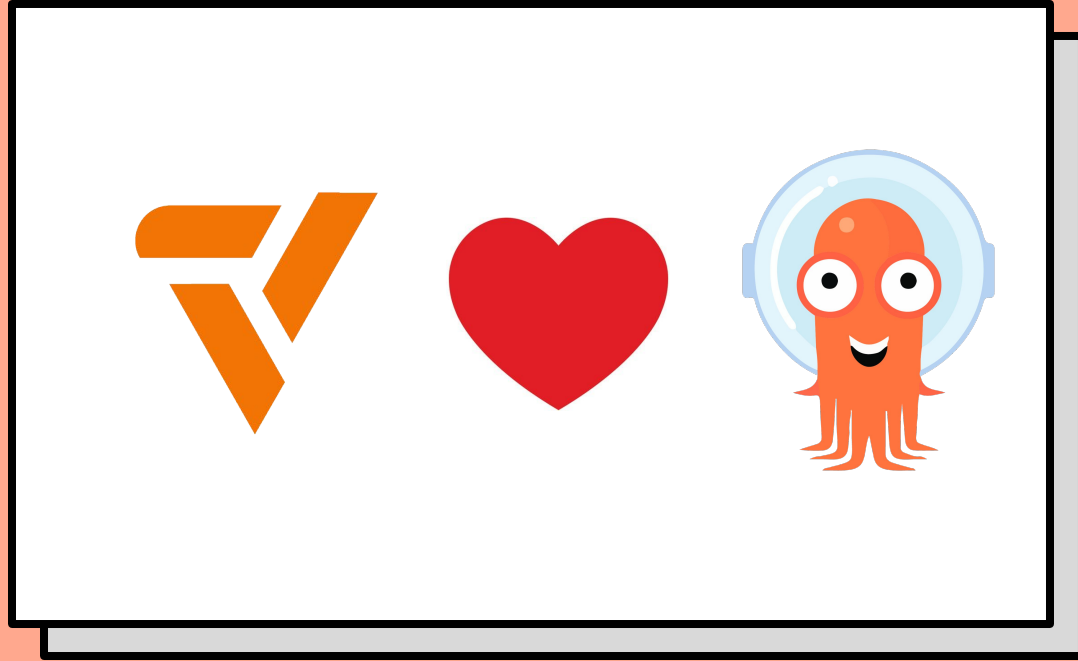

of customers in each
Kubernetes cluster

Virtual Cluster Architecture

Virtual Clusters are as lightweight and cheap as namespaces but as securely isolated as real clusters.

Better Together
